Caton

The Problem Statement.
Are you tired of maintaining medical documents?

What if you went for medical tests at a hospital, and the medical report was sent directly to your mobile?

What if you already knew the total number of patients in a particular hospital and the estimated time of your appointment if you booked now? This way, you could select the hospital based on your convenience.

What if all your medical data was available in one place, no matter which hospital you visited?

Doesn't this sound convenient?

Let us do it for you.

Nowadays, many hospitals have their own software where they store patient data. But here is the main problem: patients are not able to access this data from their homes, and they need to travel a lot for their medical reports. Patients cannot track their data from all their consultations along with a proper dashboard. Similarly, sometimes doctors need to know exactly what allergies patients have, whether their immune system is weak (do they fall ill frequently), or if the patient says they have visited 3-4 doctors but haven't found relief from their disease. During serious situations, this matters a lot. There is no centralised service for this.

What is Solution.

Caton provides the best data management dashboard along with real-time patient booking and updates on our website, ensuring your patients don't need to make extra efforts. It will all be very convenient. As our slogan goes:

Caton: Where Care Meets Convenience.

For patients, we offer an app where they can choose the right hospitals and experience the best treatment with less time and no waiting lines. They can book an appointment with the doctor anytime, so when the hospital opens the next day, they can visit at their allotted time. Alternatively, they can book appointments at any time they want.

Vision

We are dedicated to the convenience of patients and understand the importance of medical records. We are on track to create a centralised system for patients.

We are not only connecting patients to hospitals but also connecting all hospitals together so the healthcare industry can work seamlessly.

'Medical negligence': Four years on, court orders probe into child's death

Rema Nagarajan / Aug 1, 2024, 04:11 IST

New Delhi: More than four years after losing their two-year-old son due to alleged medical negligence, the parents who have been struggling to get a complete set of hospital records related to their child's treatment have got a favourable order from Rohini district court. The court observed that, from the report of the Maulana Azad Medical College (MAMC) medical board constituted to give expert opinion on the case, it was "evident that many of the hospital records were not available to it".

It also directed the police to register an FIR under IPC sections dealing with causing death by negligence (304A) and forgery for the purpose of cheating (468), within 48 hours and to investigate the matter.
